OTTAWA, CANADA

BULLETIN No. 142

MILK

OTTAWA, Sept. 24, 1907.

W. J. GERALD, Esq.,

Deputy Minister of Inland Revenue.

SIR,—Milk, which enters so largely into the food of people in health, and forms the almost exclusive food of infants and invalids, is without doubt, the most important single article of diet. When we take into account the ease with which it can be adulterated by skimming and watering, to say nothing of the use of preservatives, dyes, thickeners, and other modes of falsification, it follows that the control of milk production and distribution should receive the attention of the Department of Inland Revenue, as charged with the administration of the Adulteration Act.

This conclusion was evidently arrived at by the late Chief Analyst, Mr. Thomas Macfarlane, and the first official publication issued under his direction had reference to the establishing of a Standard for normal milk. Since October, 1887, when Bulletin No. 1 was issued, there have been 17 bulletins (including the present one) dealing with this subject, published by the Inland Revenue Department. Up to the present time, it has been found impracticable to define, legally, a standard milk. In order to aid in the fixing of such a standard, as well as to show that earnest efforts have been made by the departmental laboratory to secure trustworthy and sufficient data for such a step, I think it well to synoptize, as briefly as possible, the work recorded in departmental publications, during the past twenty years.

The subject of milk is dealt with in the following Bulletins, issued by this Department :—

No. 1	issued	October, 1887.
" 2	"	December, "
" 9	"	June, 1889.
" 11	"	October, "
" 17	"	September, 1890.
" 21	"	January, 1891.
" 28	"	" 1892.
" 32	"	March, 1893.
" 43	"	January, 1896.

No. 53	issued	December, 1897.
" 61	"	January, 1899.
" 64	"	May, 1899.
" 74	"	February, 1901.
" 80	"	December, 1901.
" 93	"	February, 1904.
" 121	"	June, 1906.
" 142	"	September, 1907.

Bulletin No. 1 contains a report upon 162 samples of whole milk, obtained in June, July and August, 1887, under expert supervision, from herds of not less than four cows. The following synopsis of results is of great interest and importance:—

	Nova Scotia.	New Brunswick.	Quebec.	Montreal.	Ottawa.	Toronto.
Number of samples examined.....	32	11	20	33	20	37
Butter Fat—Highest.....	5.40	4.62	4.18	5.17	5.29	4.50
" Lowest.....	3.00	3.45	3.02	2.80	3.02	2.52
" Average.....	4.24	3.91	3.54	3.82	4.26	3.58
Non-fat solids.....	8.48	8.54	8.85	8.47	8.67	8.70
Total solids.....	12.72	12.45	12.30	12.29	12.93	12.08
Water.....	87.28	87.55	87.01	87.71	87.07	87.93

Based upon these results, the Chief Analyst suggested the adoption of the following constants for *Standard Quality Milk*:—

Total Solids.....	12 per cent.
Butter Fat.....	3.5 "
Solids other than fat.....	8.5 "

Bulletin No. 2 contains the results of analysis of 105 samples of market milk, as supplied to twelve towns and cities, in September 1887. Nine samples containing above 5.4 per cent fat, are classified as being "partly cream," the remaining samples show the following averages:—

City or Town.	Number of samples.	Water.	Fat.	Non-fat solids.	Total solids.
Halifax, N.S.....	12	88.22	3.51	8.27	11.78
Pictou, N.S.....	5	87.12	3.86	9.02	12.88
St. John, N.S.....	9	88.01	3.96	8.03	11.99
Quebec.....	17	87.84	3.94	8.23	12.16
Montreal.....	14	87.06	3.83	9.09	12.92
Sherbrooke.....	5	86.84	4.31	8.85	13.16
Ottawa.....	6	87.17	4.20	8.63	12.83
Kingston.....	6	88.70	3.15	8.15	11.30
Belleville.....	6	87.20	4.17	8.68	12.80
Toronto.....	5	88.04	3.52	8.44	11.96
Port Hope.....	5	87.74	3.50	8.76	12.25
Peterborough.....	6	88.01	3.87	8.12	11.99
Market Milk.....	96	87.60	3.83	8.40	12.31

Although this collection (from which all samples containing more than 5.4 per cent of fat have been excluded) includes nine samples which are adjudged as "skimmed" and twelve samples which are adjudged as "watered," the average content of butter-fat and total solids fully meets the standard set for genuine milk in Bulletin No. 1.

Bulletin No. 9 contains the results of analysis of 196 samples of market milk, collected in March and April, 1889. Omitting 5 samples which contained more than 5.4 per cent fat, and 41 samples found to be skimmed or watered, the remaining 150 samples give the following averages:—

Water.....	87.42 per cent
Butter-fat.....	3.79 "
Non-fat solids.....	8.79 "
Total solids.....	12.58 "

It therefore appears that the limit of 12 per cent for total solids, and 3.5 per cent for butter-fat, as proposed in Bulletin No. 1, cannot be regarded as too high for genuine milk.

Bulletin No. 11. This important report upon 58 samples of milk, obtained in May and June, 1889, is intended to meet the point raised by the Dominion Dairymen's Association, that the standard of 12 per cent total solids, and 3.5 per cent fat proposed by Mr. Macfarlane, might be too high, so far as May and June milk was concerned; although satisfactory as regards the milk supply of other months.

Twenty four herds were examined, the average milk, morning and evening, being analyzed. Omitting one herd of pure Jerseys, whose milk averaged 5.54 per cent fat, and 15.08 per cent total solids, the mean results are:—

Water.....	87.38 per cent.
Butter-fat.....	3.66 "
Non-fat solids.....	8.96 "
Total solids.....	12.62 "

In this Bulletin there also appears the results of examining milk supplied to 16 cheese factories in the neighborhood of London, Ont. These milks include samples known to be skimmed or watered. The average results obtained are as follows:—

Water.....	87.42 per cent.
Butter fat.....	3.80 "
Non-fat solids.....	8.78 "
Total solids.....	12.58 "

When samples known to be skimmed or watered are omitted, these averages become:—

Water.....	87.26 per cent
Butter fat.....	3.93 "
Non-fat solids.....	8.81 "
Total solids.....	12.74 "

As a conclusion from these results, Mr. Macfarlane formally recommends the adoption of 3.5 per cent fat and 12 per cent total solids as a legal minimum for milk of standard quality.

Bulletin No. 17 gives the results of analysis of 165 samples of milk collected in the smaller towns of Ontario in July and August, 1890.

Judged on the basis of 3.5 per cent fat and 12 per cent total solids, the results are as follows:—

	Samples.	Per centage.
Adulterated or inferior.....	68	41
Genuine.....	97	59
Total.....	165	100

Bulletin No. 21 contains the result of analysis of 124 samples of milk from town supplies in Ontario and Manitoba in November, 1891. Judged on the basis of the proposed standard (3.5 per cent. fat and 12 per cent. solids) these were found to be as follows:—

	Analyst.	BELOW STANDARD.		GENUINE.		Total Samples
		Samples.	p. c.	Samples.	p. c.	
Towns in Ontario.....	Ellis.....	35	45	43	55	78
Towns in Manitoba.....	Kenrick....	10	22	36	78	46
		45	36	79	64	124

Professor Ellis expresses the opinion that it is impossible to assert that a milk has been adulterated with water, if the *solids not fat* are higher than 8 per cent; or that it has been skimmed if the fat exceeds 2.5 per cent.

Professor Kenrick questions the propriety of adopting any single standard for the whole of Canada.

Bulletin No. 28 gives the results of examination of 133 samples of milk collected in October, November and December of 1891 in the Kingston and London districts of Ontario and in Manitoba and the Northwest. The results may be summarized as follows:—

	Analyst.	BELOW STANDARD.		GENUINE.		Total.
		Samples.	p. c.	Samples.	p. c.	
Kingston district.	Valade.	8	30	19	70	27
London district.	Harrison.	11	20	43	80	54
Manitoba, &c.	Kenrick.	10	20	42	80	52
		29	22	104	78	133

The classification has reference to a standard of 3.5 per cent butter-fat and 12 per cent total solids.

Bulletin No. 33. This contains the results of analysis of 186 samples of milk collected throughout Nova Scotia, Quebec and Ontario in August, September and October, 1892. The results are summarized as follows:—

	BELOW STANDARD.		GENUINE.		Total.
	Samples.	p. c.	Samples.	p. c.	
Nova Scotia.	21	50	21	50	42
Quebec.	19	31	43	69	62
Ontario.	29	35	55	65	84
	69	37	119	63	188

The classification is based upon a standard of 3.5 per cent fat and 12 per cent total solids.

Bulletin No. 43. This gives the result of analysis of 251 samples of milk collected throughout the Dominion during October, November and December of 1895. These are classified as follows:—

Genuine	181	72 per cent.
Watered	11	
Partly skimmed	7	
Under average in total solids	15	28 "
" cream	18	
" non-fat solids	19	
Total	251	100

The following important note, by Mr. Macfarlane, occurs in the text of this Bulletin:—

'For the information of the public, and in order to obtain greater precision hereafter, it may be well to explain the manner in which I have made use of the above expressions, as regards whole milk. The term *watered* is used, when the non-fatty

solids are under 8 per cent, and the butter percentage is below the average (3.5), or at least, not above it. When the "non-fat solids" show the normal percentage (8.5) and a lower amount of fat than 3 per cent, it is characterized as "partly skimmed". When a sample falls below 2 per cent butter fat, the word "skimmed" is used. The expression "under average" has been used for the purpose of indicating those samples whose adulteration cannot be pronounced upon with certainty, but which are, in point of quality, inferior to those marked genuine. "Under average in total solids" is the expression used when the latter fall below 12 per cent and the sample cannot be positively characterized as "watered". When the fat ranges between 3 and 3.5 per cent, the non-fat solids being normal, the sample is said to be "under average in cream"; and when the non-fat solids fall below 8.25 per cent the sample is said to be "under average" so far as regards the latter constituents.

Bulletin No. 53. This Bulletin gives the results of analysis of 178 samples, collected throughout the Dominion in September and October 1897. The following is a synopsis:—

	Samples.	Per cent.
Genuine	115	65
Adulterated.....	19	11
Under average.....	44	24
	178	100

The classification is based upon the explanations given in Bulletin No. 43.

Bulletin No. 61 contains the results of examination of 74 samples of milk, obtained in towns of Ontario, in October, November and December of 1898. These were found as follows:—

	Samples.	Per cent.
Genuine.....	54	73
Adulterated.....	3	4
Under Average.....	17	23
	74	100

Bulletin No. 64 contains the results of analyzing 29 samples of milk, taken in Montreal, St. Hyacinthe and Sherbrooke, Que., in January and February, 1899.

	Samples.	Per cent.
Genuine.....	21	72
Adulterated.....	8	28
	29	100

This Bulletin also contains a study of the acidity of milk by A. L. Tourchot; and some work on the determination of Lactose and Casein.

Bulletin No. 74 contains the results of analysis of 131 samples, obtained throughout the Dominion, in November and December, 1900.

	Samples.	Per cent.
Genuine.....	104	79
Adulterated &c.....	27	21
	131	100

Preservatives (especially borates) were looked for. None were found.

Bulletin No. 80 contains the results of analysis of 182 samples of milk, taken throughout the Dominion, in September and October, 1901.

	Samples.	Per cent.
Genuine.....	116	64
Adulterated.....	7	4
Doubtful.....	59	32
	182	100

In this Bulletin, the Chief Analyst gives more precise meaning to the term "Under average in non-fat solids"; applying it only in cases where the solids not fat are under 8.25 per cent; but the butter-fat above 3.75 per cent, and the total solids, not under 12 per cent.

Bulletin No. 83 gives the results of analysis of 224 samples of milk, collected in November and December of 1903, throughout the Dominion.

	Samples.	Per cent.
Genuine	159	71
Adulterated	23	10
Under average	42	19
	<hr/> 224	<hr/> 100

Bulletin No. 181. This Bulletin deals with the inspection of skim-milk, buttermilk and cream, as well as with whole milk. Results of analysis of 332 samples of whole milk collected throughout the Dominion in April and May, 1906, are as follows:—

	Samples.	Per cent.
Partly cream	13	4
Genuine	189	57
Adulterated	48	14
Doubtful	85	25
	<hr/> 332	<hr/> 100

Comment.

Bulletins 1 and 11 contain the results of analysis of a very large number of authentic milks; representative of 165 herds of cows, containing from 4 to more than 50 cows each. The period represented, includes the months of May, June, July and August. The following resumé, gives the results at a glance:—

Locality.	No. of Herds.	No. of Cows.	Average Fat.	Average Total Solids.
Bull. No. 1	Nova Scotia.....*	32	4.24	12.73
	New Brunswick	11	3.91	12.45
	Quebec	29	3.54	12.30
	Montreal and vicinity....	35	3.32	12.29
	Ottawa and vicinity	9	4.26	12.93
Bull. No. 11, London and vicinity.....	Toronto and vicinity....	37	3.38	12.06
		28	3.06	12.62
	<hr/> 165	<hr/> 2,067+	<hr/> 3.80	<hr/> 12.62

About 2,500 cows are represented in this synopsis and it is evident that, so far as averages are concerned, the minimum limits of 3.5 per cent fat and 12 per cent solids, are fully justified.

Closer inspection of the results shows that 10 herds (comprising about 118 cows) yielded milk containing less than 3 per cent of fat. (Mean fat = 2.78 per cent) and less than 12 per cent total solids (mean total solids = 11.36 per cent).

The lowest butter-fat given by any herd is 2.52 per cent. This is from a herd of 10 cows in the vicinity of Toronto; and it is noteworthy that the Toronto district shows the poorest quality of milk, an average for 37 herds, numbering about 400 cows, being 3.38 per cent fat, and 12.06 per cent total solids.

Thirty-five herds (numbering about 380 cows) show butter-fat between 3 and 3.5 per cent, the average for this lot being 3.2 per cent. The total solids average about 11.8 per cent.

It will be noted that the work recorded in Bulletins 1, 2, 9 and 11, is made a basis for determining the limits, below which milk should be regarded as "adulterated" within the meaning of the Act. As a result of this study, the late Chief Analyst concluded that 3.5 per cent of butter-fat and 12 per cent. total solids was a reasonable standard. Individual cows failed to meet this standard; and, indeed, 45 out of 142 herds, reported in Bulletin No. 1, yielded milk containing less than 3.5 per cent fat; ten (10) of these falling below 3.0 per cent. The fact that the remaining herds yielded milk so much above 3.5 per cent. as to bring the whole up to 3.86 per cent, was held to prove that the average of 3.5 per cent fat could easily be reached by any dairyman who properly selected and properly cared for his stock; and that the dairyman who purposely selected his cows with regard to quantity of milk, and without reference to quality, should not be permitted, unchallenged, to compete with those who, (constituting the large majority in every province of the Dominion) furnished milk which fully met the requirements of 3.5 per cent fat, and 12 per cent solids.

The work in subsequent bulletins consists of the analyses of market milks, interpreted in terms of the recommended standard.

The following table presents a synopsis of the results, and is important as showing how the adoption of a standard of 3.5 per cent fat and 12 per cent solids, affects the classification of market milk, as sold in Canada.

Number of Bulletin.	Number of Samples.	Genuine (per cent.)	Doubtful (per cent.)	Adulterated (per cent.)
17.....	165	59	19	22
21.....	124	64	26	10
28.....	133	78	7	15

	2,011	66	23	11

INSPECTION of 1907.

The work recorded in the tables now submitted, has been done upon 343 samples of whole milk, collected in July and August of this year. They represent all the inspectional districts of Canada, with the exception of Manitoba.

I have applied to the interpretation of the analytical results the same standards for fat, total solids, and non-fat solids which my predecessor used in work of this kind. The following table shows, at a glance, the general conclusions.

Inspectional district.	Total samples.	Genuine		Skimmed or partly skimmed.	Watered.	Doubtful.
		Normal.	Abnormal.			
Nova Scotia.....	30	21	4	1	4	0
P. E. Island.....	15	9	2	3	0	1
New Brunswick.....	30	22	5	1	2	0
Quebec.....	30	10	10	8	1	1
St. Hyacinthe.....	30	19	4	6	1	0
Montreal.....	30	9	20	1	0	0
Ottawa.....	30	19	11	0	0	0
Kingston.....	30	15	15	0	0	0
Toronto.....	30	3	10	7	8	2
London.....	30	15	13	0	0	0
Calgary.....	28	27	3	0	0	0
British Columbia.....	30	2	14	9	5	0
	343	171	111	36	21	4
		282				

The average percentage of genuine samples is 82, and is distinctly higher than at any previous inspection. The percentages of genuine samples for each district in regard to the total number of samples collected in that district, are as follows:—

District.	Samples examined.	Genuine.
Nova Scotia.....	30	83 per cent.
P. E. Island.....	15	73 "
New Brunswick.....	30	90 "
Quebec.....	30	69 "
St. Hyacinthe.....	30	77 "
Montreal.....	30	97 "
Ottawa.....	30	100 "
Kingston.....	30	100 "
Toronto.....	30	43 "
London.....	28	100 "
Calgary.....	30	100 "
British Columbia.....	30	55 "

It thus appears that the districts of Toronto and British Columbia stand out prominently as those in which the milk supply is of very low quality.

In conclusion, I am of opinion that the standard proposed by the late Chief Analyst in 1887, is a reasonable one, and can easily be met by any dairyman who pays proper attention to his herd. Nor can it be urged that this standard is inapplicable to the summer months. Evidence to the contrary is furnished not alone by the collection specially made for this purpose in 1889 (Bulletin No. 11), but by many subsequent collections, including that now reported.

It is, however, undeniable that some individual cows, and even some herds, yield milk containing less than 3.5 per cent fat. We have on record, ten herds (118 cows) whose milk averaged only 2.78 per cent, and one herd of 10 cows gave only 2.52 per cent fat.

These herds were in Toronto district (1889) and it will be noted that it is in Toronto district that the poorest showing occurs, in the present inspection. Dr. Ellis, Public Analyst at Toronto, has recorded his opinion that it is impossible to assert that a milk has been adulterated with water, if the *solids not fat* exceed 8 per cent, or that it has been skimmed, if the fat exceeds 2.5 per cent. This opinion is certainly justified, if certain herds in the Toronto district may be included among normal milk producers.

In the face of what has been recorded I am compelled to admit that while I believe the standards for milk recommended by the late Chief Analyst to be reasonable, and already attained throughout the greater part of Canada, it is impracticable that they could be enforced by legal enactment over the whole of Canada. Without going so far as to say that the cow must herself be consulted in the matter of quality of milk, it is undeniable that the existence of many herds, whose average milk shews less than 3 per cent of fat, and less than 11.5 per cent total solids, makes the universal adoption of a three and a half per cent standard impossible.

It remains, however, quite possible for towns and cities to fix local standards for their own milk supplies. And this, it seems to me, is the proper course to be pursued, at least for the present. In an appendix, I have given a list of cities and towns, in which by-laws regulating the quality of milk which may be sold therein, already exist. That the low quality of milk now produced in certain districts, could be raised to the proposed standard quality, by proper care on the part of dairymen, goes without saying. The natural incentive to needed improvement is, quite evidently, that the cities and towns purchasing such milk, should insist upon their supplies having a fixed minimum value in fat and total solids. The local authorities must of course, be charged with the responsibility of seeing that such enactments are enforced.

The work which this department can do, in aiding the improvement of this most important food substance, is apparently limited to an occasional inspection, throughout the whole country, with a view to ascertaining the general condition of milk supplies. To fix a lower standard than 3.5 per cent fat, and 12 per cent solids, would be to give endorsement to a quality of milk lower than the average quality now produced. I have already given my reasons for believing that it would be impracticable at present to enforce a standard of 3.5 per cent fat, and 12 per cent total solids, over the whole Dominion.

It is to be noted, in conclusion, that the work herein summarized has regard to the nutritive value of milk, i.e. its value as a food. But there is another aspect of the milk problem which ought not to be ignored. The cleanliness of market milk is second only in importance to its nutritive value. Apart from the disgusting character of the impurities which must be present in milk, unless the most scrupulous attention is paid to its production, the danger from disease germs present in it is very great indeed. It is not going too far to say that (omitting dessicated foods) just in proportion to the nutrient value of the material, is its suitability as a medium for the development of microbial life. It is at once apparent that milk may become a most efficient propagating medium for disease germs. The following quotation is from a recent publication of the Bureau of Animal Industry, Washington, D.C.

"EVIDENCE THAT MILK IS A CAUSE OF DISEASE."

1. It has been shown by the most painstaking investigation, extending over a long period of years, that certain diseases in the animal are communicable through the medium of the milk, this being especially true of tuberculosis, foot-and-mouth disease, anthrax and cowpox; and that diseases like garget, gastro-enteritis and septic fevers in the cow will render the milk morbid to men.
2. It has been shown that animals which have fed on poisonous forage plants or have been treated with strong medicaments are disqualified from producing a pure or sound milk.
3. During the past twenty-five years there have been published in the different medical journals the histories of 195 epidemics of typhoid fever, 99 of scarlet fever and 36 of diphtheria, all traceable to the milk supply.

In the recent exhaustive investigation conducted by the highest health authority in this country, viz., the United States Bureau of Public Health and Marine-Hospital Service, the commission definitely traced 85 of the 866 cases of typhoid fever (about 10 per cent) in the District of Columbia to the use of infected milk.

4. It has been shown in a former report that in the District of Columbia about one fourth, and in the country at large about one sixth, of all the children born perish before the completion of the first year; that nearly one-half of the deaths in children under 1 year of age are caused by gastro-enteric diseases, chiefly infantile diarrhoea; and that of the 54,047 infantile deaths which have been investigated at home and abroad with reference to feeding, 86.6 per cent had been artificially fed, all of which points with more than mere suspicion to the fact that the morbid agent is introduced into the body with the food (cow's milk).

This phase of the milk question must evidently be left to local action.

I have the honour to be, Sir,

Your obedient servant,

A. MCGILL,

Chief Analyst.
